

Discovery Piscine Side Project - 2

The Local Duel (Rock, Paper, Scissors)

A 42 Singapore SUTD initiative

Summary: You will create a rock-paper-scissors game

Version: *0*

Contents

I	**Preamble**	**2**

III	**Specific instructions for this exercise**	**4**
IV	Excercise **00:** The Local Duel (Rock, Paper, Scissors)	**5**

Chapter I

Preamble

The DEC PDP-1 is a sleek, refrigerator-sized mainframe and the undisputed birthplace of competitive digital multiplayer!

It's sort of like a modern high-end gaming desktop (but costing $120,000 in 1961 and drawing enough power to light up a city block), combining a round cathode-ray tube monitor with custom-built toggle-switch control boxes. The PDP-1 is particularly suited for real-time interactive calculations, processing rapid operator inputs, and proving that humanity will happily stand shoulder-to-shoulder at a single console just to blast each other out of a virtual orbit.

The interface section consists of a cathode ray tube capable of glowing with individual vector coordinates—no modern graphics processing unit required! You can use it to map stellar gravity wells, parse immediate toggle inputs, or track the velocity of custom torpedoes! Steve Russell and his team of MIT hackers used this exact kind of interactive terminal to create *Spacewar!*, an experience so mechanically addictive that it became the ultimate test of reflex and strategy for early computer scientists! All the professional competitive capabilities you'd expect from the absolute origin of head-to-head gaming are here, and more!

Simultaneous Input Evaluation is at the crux of the console, where you make the machine judge the precise moment two forces collide! It offers a relentless, quick-fire cycle of comparing player decisions in real time. Conditional logic and competitive state management, exactly like the `if`, `elif`, and `else` blocks paired with input masking modules you will use to build your Rock, Paper, Scissors duel, are the absolute core of the experience. Refining your secret commands to outsmart your opponent sitting right next to you can be done instantaneously and meticulously tweaked.

Total head-to head control, real-time visual feedback, an iconic glowing round screen, and the ability to declare your absolute tactical dominance over your peer sharing your keyboard make the DEC PDP-1 the most professional quality dueling machine out there!

Chapter II

General rules

- Read the subject completely. Do not rush. Read the instructions carefully from start to finish before writing a single line of code or creating your repository.
- Peer-to-peer learning is your first resource. If you have a question, ask your right neighbor. If you still have a question, ask your left neighbor. You are encouraged to search the internet and use AI.
- The Staff is not your search engine. You should only reach out to the pedagogical team after you have exhausted all other options and discussed the issue with your peers.
- Must use python!
- Have fun. This is your project. Make it yours!
- Vibe coding is allowed. Chill and, again, just have fun.

Chapter III

Specific instruction for today

- Upon completion, present your work to your cohort.

Chapter IV Exercise 00:

The Local Duel (Rock, Paper, Scissors)

	Exercise 00
Exercise 00: The Local Duel (Rock, Paper, Scissors)	
Turn-in directory : you need to figure this out/	
Files to turn in : `rps_duel.py`	
Allowed: Vibe Coding	

Concept
A digital, two-player version of the classic Rock, Paper, Scissors game. Both players will use the same keyboard to play against each other in a "Best of 3" tournament.

Learning:
Conditional Logic (`if`, `elif`, `else`), Loops, and Input Masking..

Teamwork Mechanic:
1. Prompts the AI to build the core game rules (e.g., Rock beats Scissors, Paper beats Rock) and the scoring system.
2. Since both players share a screen, you must prompt the AI to figure out how to hide the players' inputs so they can't see what the other person typed (Hint: tell the AI to look up the `getpass` module).

Specific Instructions & Checklist:
[ ] The game must start by asking for Player 1's name and Player 2's name.
[ ] The script must use a loop to play exactly 3 rounds.
[ ] For each round, the game must ask Player 1 for their choice (Rock, Paper, or Scissors), and then ask Player 2 for their choice.
[ ] The Security Patch: The inputs *must be hidden* when typed. The AI must be prompted to implement a way to mask the keystrokes so players cannot cheat.
[ ] The game must compare the two choices, announce the winner of the round, and update the score.
[ ] The script must handle ties correctly (nobody gets a point, or both get a point, but the AI must be told exactly how you want it handled).
[ ] At the end of the 3 rounds, the program must announce the final Grand Champion based on the total score.

Exciting, right?

Chapter V

Submission and peer-evaluation

Present your work to the world

`The evaluation process will happen` when you present to your cohort
